

# **Customer Analytics for Leading E-Commerce Company**

## **The objective of the Business Problem:**

One of the leading e-commerce companies in India would like to analyze their transaction data and understand the drivers for churners and high spenders. Along with that, the company wants to understand overall customer behavior so that they can define the strategy to improve the revenues/margins. To answer the above problem, the team provided data files as follows.

- Customer: Customer level information
- Product: Product Hierarchy information
- Transactions: Transaction information (orders information)
- Data Dictionary: Description of the tables & fields

## **What do you require to work?**

To achieve the solution,

1. The team would like you to work on the “Customer360 data set” using instructions (description) provided in “Customer360 Instruction.xlsx”. As part of this file, every record will be at the customer level (aggregating the information at the customer level).
2. Once we created the Customer 360 data set created from step 1, you are required to perform the below analysis
  - Identify key drivers of churners (You can build a classification model using Churn\_flag as a dependent variable)
  - Identify key drivers of High spenders (You can build a classification model using High\_spenders\_flag as a dependent variable)
  - Understand customer behavior (Knowing about customers) (You can build different types of segmentation & Profiling to identify characteristics)
